

FINAL PROJECT — GROUP PRESENTATION**Expository Writing****From Character to Game: Writing, Design Thinking, and AI Collaboration****Overview**

- Each group presents for 3-4 minutes in front of the class
- Every group member speaks
- Time is strictly enforced, so prepare accordingly
- Your prototype visuals are prepared as slides and run throughout the presentation
- This is not a summary of what you did, it is a design argument for what you built and a vision for where it could go
- How you divide the presentation is your decision, but each group member must speak to something distinct
- You cannot paper read or slide read

Dress Code

- Business casual: look professional
- You are pitching your work, not presenting an assignment
- This is your space to practice for professional events, treat it as one

What your presentation must cover

How you sequence these, who covers what, and how much time each receives is a design decision your group makes together. All four must be addressed.

The system argument

- What did these four specific characters make possible together that none of them could have produced alone?
- Argue why this combination produced this game and not any other
- Do not introduce each character individually — argue the system

From writing to mechanic

- Trace one specific piece of A3 writing — a contradiction, a pivotal moment, a strength
- Show exactly how it became a rule, a trigger condition, or a mechanic

- Name the character, name the writing, name the rule it produced
- The connection must be specific and traceable

What AI got wrong

- Identify one moment where NotebookLM misread your game — a contribution it flattened, a rule it got wrong, an output that did not match your design
- What did you correct?
- What does that correction reveal about what AI cannot do with creative work?

Vision

- What makes this game visually and mechanically distinct from any other game?
- What age group would play it — argue in terms of the mechanic and emotional demand, not just theme
- What would a second version explore that this design could not yet reach?

Prototype Visuals

- Prepare a small set of slides using your AI-generated prototype images as visual aids
- These are not decoration — they are evidence of the work you have done
- Your slides should show the game components, the character visuals, and any other prototype images that support your argument
- Slides stay visible throughout the presentation
- Reference them when they strengthen what you are saying, particularly when making the case for what makes the game visually distinct and when tracing the writing-to-mechanic connection

What makes a strong presentation

- Makes one clear argument per point
- Is specific, names characters, rules, moments, and decisions rather than describing the process in general terms
- Treats prototype visuals as part of the argument, not as background
- Leaves the audience with a clear sense of what this game is, why it exists, and where it could go

- A weak presentation summarizes the worksheets, four group members covering the same ground in different words is not a group presentation, it is four individual reports delivered in sequence

PRESENTATION RUBRIC — From Character to Game Total: 35 points

Criterion	5 — Excellent	3 — Proficient	2 — Developing	1 — Inadequate	Score
1. Design Argument The group argues why these four characters produced this specific game and no other.	The argument is clear, specific, and compelling. The connection between the four characters and the game is explicit and well-reasoned. The system is argued, not individual characters introduced.	The argument is present and mostly clear but misses one connection or relies on general statements in places.	The group summarizes what they did rather than arguing why it works. Descriptive rather than analytical.	No clear argument is made. The presentation introduces characters individually or summarizes the worksheets without making a design case.	/5
2. Writing to Mechanic One specific piece of A3 writing is traced to a rule, trigger condition, or mechanic.	One specific piece of A3 writing is named and traced precisely to a mechanic. The connection is clear and traceable. The audience understands exactly how the writing became a design decision.	The connection is made but partially general — the writing or the mechanic is named but the link between them is not fully explained.	A connection is mentioned but remains vague. It is not clear which piece of writing produced which mechanic or rule.	No connection between A3 writing and game mechanics is made.	/5
3. AI Reflection The group identifies a specific moment where NotebookLM got something wrong, what they corrected,	A specific moment of AI error is identified. The correction is explained clearly. The group draws a meaningful insight about what AI cannot do with	A moment of AI error is identified and corrected but the insight about what it reveals is general or underdeveloped.	The group acknowledges AI limitations in general terms without identifying a specific moment or making a clear correction.	No critical reflection on AI collaboration is present. The group only describes what NotebookLM produced without evaluating it.	/5

Criterion	5 — Excellent	3 — Proficient	2 — Developing	1 — Inadequate	Score
and what that reveals.	creative or design work.				
4. Vision The group makes a case for what makes the game distinct, who would play it, and where a second version would go.	All three elements are addressed specifically. The age group argument is made in terms of mechanic and emotional demand. The second version reveals genuine insight into what the current design could not reach.	All three elements are addressed but one is underdeveloped — for example the age group is stated without being argued.	Only one or two elements are addressed. The vision section feels like an afterthought rather than a genuine argument.	No vision is presented. The presentation ends with the design without looking forward.	/5
5. Prototype Visuals Slides show the game components, character visuals, and prototype images. Visuals support and strengthen the argument.	Visuals are well chosen and directly support what is being argued. The audience can see the game clearly. Speakers reference the visuals naturally and purposefully, the slides and the argument work together.	Visuals are present and relevant but not always referenced or connected to what is being said. The slides and the argument run in parallel rather than together.	Visuals are present but generic or poorly chosen. They add little to the argument and are rarely referenced by speakers.	No visuals are used or visuals are irrelevant to the game and the argument being made.	/5
6. Group Cohesion The group presents as a unified team with each member	Every member speaks with a clearly distinct contribution. The presentation flows as one coherent	Every member speaks and contributions are mostly distinct but one speaker overlaps	Every member speaks but the presentation feels like four individual reports delivered in	Not every member speaks, or multiple members deliver the	/5

contributing something distinct.	argument, not four separate reports. Transitions between speakers are smooth and the group demonstrates awareness of each other's contributions.	significantly with another or transitions feel disconnected.	sequence. There is little sense of the group as a unified team.	same content, or the presentation has no coherence as a group effort.	
8. Time Management The group completes the presentation within the 3-4 minute limit.	Presentation falls comfortably within 3-4 minutes. Pacing is controlled and deliberate, no rushing at the end.	Presentation is slightly over or under but within 30 seconds of the limit.	Presentation exceeds the limit by more than 30 seconds or is significantly under, suggesting poor preparation.	Presentation is cut off due to time or is so short it does not adequately cover the required content.	/5
